

# Introduction – The Basics

**Please read this page before using the Electronics Area.**

The Electronics Area provides tools, equipment, parts, and supplies for building, testing, and troubleshooting electronic projects.

Two workstations are available for member use. Both stations are equipped with soldering tools, and Station 1 includes a variety of electronic test equipment ready for use.

Common consumable supplies such as solder, flux, and hookup wire are stored in and around the workstations.

A mobile storage rack contains free electronic components available for member projects. These parts are donated by members and the community. If you find the parts inventory useful, please consider contributing components or making a donation to the Makerspace. Maintaining a well-stocked parts collection benefits everyone.

## **Safety**

Electronics projects can present hazards to both people and equipment if tools and materials are used improperly. Before using this area, please read the **Warnings and Cautions** section and follow all posted safety guidelines.
