

How to use the label printer

We have a Brother QL-710W thermal label printer on our network! It is attached to a Raspberry Pi, which provides a very nifty web interface for it.

To use this label printer:

1. Make sure it is on. Look for a green status light; if there is no light, press the power button on the front.
2. In any web browser, go to <https://labelmaker.bellinghammakerspace.org>
3. Print your label!
